

L Flip Storyboard

Learner-driver logbook app with smart flip-over L-plates · Part 1: First launch & setting up the hardware

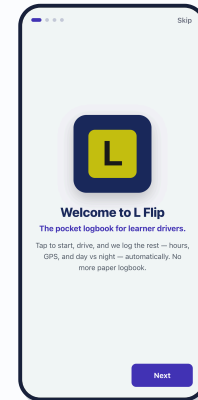

1 First launch: sign up or sign in

Creates an account

New learners **register** with their state (hour targets differ per state). A one-tap **demo account** lets anyone try the app first.

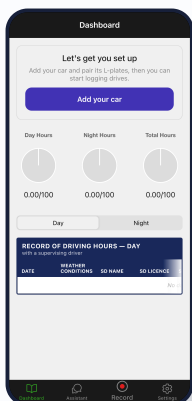

2 Welcome tour

A short tour introduces the idea: **tap to start, drive, and the hours log themselves**. No more paper logbook.

Taps through the tour to the Dashboard

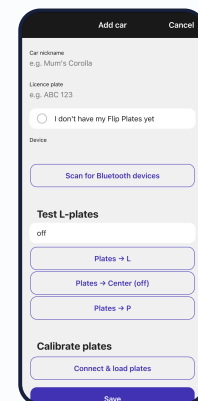

3 Dashboard, new user

Taps "Add your car"

The empty dashboard points straight at setup: **"Add your car and pair its L-plates."** The tab bar (Dashboard · Assistant · Record · Settings) is the app's main navigation.

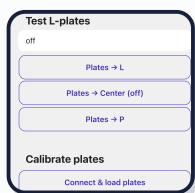

4 Add a car & pair its plates

One form does it all: name the car, then **scan over Bluetooth** for its L-plate controller. No hardware yet? Tick **"I don't have my Flip Plates yet"** and log drives anyway.

Controller paired. Time to test the plates

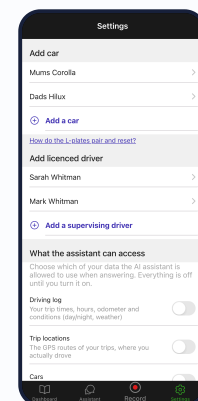

5 Test flip & calibrate

Plates respond: hardware confirmed

Still in the same form: **Plates -> L / Center / P** test buttons fire the real hardware, flipping the plates mounted **inside the car's windows**. A calibration tool jogs each servo to its safe end-points.

6 Cars & supervising drivers saved

Settings holds the family's **cars and full-licence supervisors** (name + licence number, as the logbook requires), plus privacy toggles for what the AI assistant may see.

Setup complete: car paired, plates calibrated, supervisors saved. Next: logging a drive
