

L Flip Storyboard

Learner-driver logbook app with smart flip-over L-plates · Part 2: Logging a supervised drive

7 Record tab, ready to go

In the car, the learner checks the **odometer**, picks the car and supervisor, and the button goes green. "Guest" options mean a drive can be logged even with nothing set up.

Taps "Start Trip"

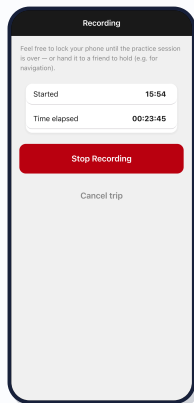

8 Plates flip to "L" by themselves

The app auto-connects to the car's **master controller**, which relays the command by radio to the **battery-powered plate units in the front and rear windows**. Servos flip both plates to show **L**. No getting out of the car.

Plates showing L. Recording begins

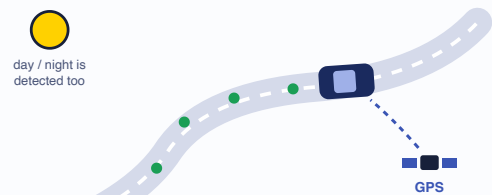

9 Recording, phone can be locked

Timing and **GPS run in the background**, so the phone goes in a pocket or cradle. The learner concentrates on driving, not the app.

Drives the session while GPS logs the route

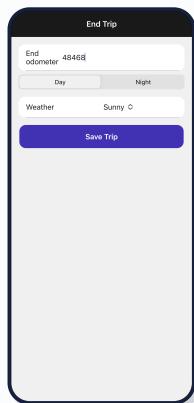

10 The drive itself

Every drive builds the logbook: **route, distance, duration and day/night** are captured automatically instead of being written down from memory afterwards.

Back home, taps "Stop Recording"

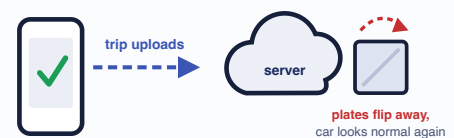

11 End trip: details pre-filled

Only the **end odometer** needs checking. Day/night comes from the clock and the **weather ("Sunny") is auto-detected** from a forecast service for the trip's location.

Taps "Save Trip"

12 Saved and synced, plates hide

The trip **syncs to the cloud logbook** (and queues offline if there's no signal). The plates **flip back to hidden**, so the car is instantly right for a full-licence driver.
